
Kate Dodds

PhD Candidate
Macquarie University

Kate Dodds is a PhD student at Macquarie University interested in developing effective eco-engineering solutions for marine infrastructure. This process, also referred to as green engineering, attempts to increase the ecological value of anthropogenic structures in the marine environment. Kate's research currently focusses on the greening of seawalls to encourage the development of abundant and diverse intertidal communities. She will give an oral and poster presentation of her work on living seawalls at AMSA 2019.
